Experience

Senior Software Engineer – GOAT Group (Remote)

February 2021 – Present

- Implemented and owned the orders management backend portion of our cross-listing feature (Go) to allow certain sellers to list products and fulfill orders on GOAT, Grailed, and other partnered platforms.
- Designed, built, and owned the backend implementation for a new seller fulfillment flow on GOAT's Alias selling platform (Go), which allowed sellers to fulfill their orders by having couriers come to their address location to pick up the order package.
- Built and scaled our shipping optimization rules engine (Ruby on Rails) evaluating seller/buyer location, warehouse location, and other configurable business rules to select the most cost-effective carrier and label.
- Migrated legacy hard-coded shipping logic into our shipping optimizations rules engine, eliminating the need to deploy for rule changes.
- Integrated GOAT's shipping infrastructure (Ruby on Rails) with multiple worldwide carriers, extending our marketplace reach to sellers and buyers internationally.

Software Development Engineer II – iHerb LLC (Irvine, CA)

June 2018 – February 2021

- Worked on the breakdown and migration of multiple services from the legacy monolithic .NET Framework application to containerized .NET Core microservices, which improved system resilience, performance, and deployability.
- Built a standardized microservice development template with built-in Kubernetes deployment templates, CI/CD pipeline integration, to improve developer velocity and consistency across microservices.
- Worked on integrating iHerb's shipping infrastructure with multiple carriers via API integrations which allowed buyers a wider variety of carriers to select when making purchases on the site.
- Designed and launched a freight-forwarding platform with end-to-end tracking visibility to help reduce shipping delays.

Software Engineer II – AT&T (El Segundo, CA)

August 2015 – June 2018

- Built and maintained various Java Spring Boot microservices that powered DirecTV Now's streaming platform.
- Designed and implemented a scalable real-time messaging system using Apache Kafka, delivering internal notifications to various other services that subscribed to the system.
- Worked on a CDN management system with dynamic load balancing across multiple providers, optimizing delivery performance and reducing bandwidth costs.

Software Engineer, Support – Mirth Corp (Costa Mesa, CA)

November 2014 – August 2015

- Developed healthcare data integration solutions using Mirth Connect and HL7 standards, ensuring HIPAA compliance and interoperability.
- Provided technical support and troubleshooting for enterprise clients, resolving critical system issues and implementing performance optimizations on their Mirth software and hardware implementations.

Education

University of California, Irvine (B.S. Computer Science)

Technical Skills

Programming Languages: Java, Go, C#, Ruby, SQL

Databases: PostgreSQL, SQL Server, Redis, NoSQL

Frameworks & Technologies: .NET Core, Spring Boot, Ruby on Rails

API Design: REST, gRPC/Protobuf

Cloud & Infra: AWS, Kubernetes, Docker, CI/CD

AI-Assisted Development: Claude Code — spec design, implementation planning, test planning and code generation. Hands-on review of every plan and diff against requirements and edge cases.
